

Chapter 3. BUFFER MEMORY CONFIGURATION AND FUNCTIONS

The thermocouple-input module has the PLC CPU and the buffer memories for data communications.

3.1 Buffer Memory Configuration

The followings describe buffer memory configuration.

3.1.1 K7F-TC4A Buffer Memory

Address (Decimal)	Function	Description	Default Setting	Read / Write																								
0	Channel enable/disable Specification	Bit On(1): Enable, Bit Off(0) : Disable	Disable	R/W																								
1	Specifying the type of thermocouple for channel 0	<table><tr><th>Input specification No.</th><th>Sensor type</th><th>Temperature range</th></tr><tr><td>0</td><td>K</td><td>-200.0 to 1200.0°C</td></tr><tr><td>1</td><td>J</td><td>-200.0 to 800.0°C</td></tr><tr><td>2</td><td>E</td><td>-150.0 to 600.0°C</td></tr><tr><td>3</td><td>T</td><td>-200.0 to 400.0°C</td></tr><tr><td>4</td><td>B</td><td>400.0 to 1800.0°C</td></tr><tr><td>5</td><td>R</td><td>0.0 to 1750.0 °C</td></tr><tr><td>6</td><td>S</td><td>0.0 to 1750.0°C</td></tr></table> <p>If a value outside the defined range is set, the bit of address 67 that corresponds to the channel turns on and the thermocouple type will be set to type K.</p>	Input specification No.	Sensor type	Temperature range	0	K	-200.0 to 1200.0°C	1	J	-200.0 to 800.0°C	2	E	-150.0 to 600.0°C	3	T	-200.0 to 400.0°C	4	B	400.0 to 1800.0°C	5	R	0.0 to 1750.0 °C	6	S	0.0 to 1750.0°C	Type K	R/W

3.2 Buffer Memory Functions

- ▶ Each address in the buffer memory occupies one word and it is represented with 16 bits.
- ▶ In the 16 bits which compose an address, every bit can be set to either "1" when it should be turned On or "0" when Off in order to implement the function of each bit.

3.2.1 Specifying Channel Enable/Disable

(K7F-TC4A : Address 0, K4F-TC2A : Address 0)

- 1) Temperature conversion enable/disable specification is possible on every channel.
- 2) Disabling unused channels makes the sampling cycle short.
- 3) No specification means that all channels are disabled.
- 4) The followings show temperature conversion enable/disable for each channel.

(1) K7F-TC4A

(2) K4F-TC2A

8.2.2 Specifying the Type of Thermocouple (K7F-TC4A : Address 2 to 16, K4F-TC2A : Address 1 to 4)

- 1) Type specifying the thermocouple that is connected to each channel of the thermocouple input module is possible by the channel.
- 2) Default is type K.
- 3) The followings show the number of specification for each channel.

Specification No.	0	1	2	3	4	5	6
Thermocouple type	K	J	E	T	B	R	S

- 4) Other value than the defined values is set for specifying the type of a thermocouple, the K7F-TC4A displays error code at the corresponding bit in the address 67 and the K4F-TC2A in the address 19 with the type being specified to "0", that is, type K thermocouple.

3.2.3 Temperature Conversion Value

- 1) This area performs sampling processing of the temperature value that is inputted through the thermocouple connected to the terminal block of a channel and stores the value of 10 times of the real temperature value.

REMARK

If a real temperature is 123.4°C the stored value is 1234.

- 2) The followings show the configuration of each address.

- 3) If the temperature conversion specifying a channel is changed from temperature conversion enable into temperature conversion disable, the temperature conversion value just before the change remains.

8.2.4 Digital Conversion Value

- 1) A temperature value that is inputted through the thermocouple connected to the terminal block of a channel is converted into a value between 0 to 16000, and then the converted value is stored. That conversion is called digital conversion.
- 2) The digital conversion value converted to a value between 0 to 16000 can be used as a process value of the PID control module.
- 3) The digital conversion value and the detected temperature value have the following arithmetic relation.

$$\text{Digital conversion value} = (16000/\text{overall measuring temperature range}) \times (\text{temperature conversion value} - \text{minimum measuring temperature})$$

REMARK

If a real temperature is 123.4°C when using a type K thermocouple, since the temperature conversion value is 1234, overall temperature range is 14000 and minimum measuring temperature is -2000, then the digital conversion value is $(16000/14000) \times [1234 - (-2000)]$, and it is equal to 3696 (round off at the first digit of fraction).

Thermocouple type	K	J	E	T	B	R	S
overall measuring temperature range	14000 (-2000 to 12000)	10000 (-2000 to 8000)	7500 (-1500 to 6000)	6000 (-2000 to 4000)	14000 (4000 to 18000)	17500 (0 to 17500)	17500 (0 to 17500)
Minimum measuring temperature	-2000	-2000	-1500	-2000	4000	0	0

- 4) If the temperature conversion specifying a channel is changed from enable into disable, the digital conversion value before the change remains

3.2.5 Error Code

- 1) Disconnection that can occur between the thermocouple and the thermocouple input module is detected by its type, and also error information is stored when the detected temperature is outside the defined range.
- 2) The following shows the types of error code.

Error Code (Decimal)	Error	Data processing at an error occurrence	RUN LED
16	Disconnection	The temperature conversion value and digital conversion value before an error occurrence is retained.	1 sec cycle flickering
17	Out-of-range temperature		
18	Reference junction compensation device error		

- 3) If two or more errors are detected, the priority order is 18, then 17 and then 16.

3.2.6 Setting SET Data (K7F-TC4A : Address 65, K4F-TC2A: Address 17)

- 1) If a bit corresponding to each channel in Set Data specification area is turned On(1), then the thermocouple input module executes the temperature conversion with user-defined setting data at the address 0 to 16 in the K7F-TC4A, and at the address 0 to 4 in the K4F-TC2A.
- 2) If the bit corresponding to each channel is not turned On(1), then the thermocouple input module executes the temperature conversion not with the new user-defined setting data at the address 0 to 16 in the K7F-TC4A and at the address 0 to 4 in the K4F-TC2A but with the previous setting data.
- 3) The followings show the SET data enable/disable specification.

(1) K7F-TC4A

(2) K4F-TC2A

3.2.7 Information on Run Channel (K7F-TC4A : Address 66, K4F-TC2A : Address 18)

This area stores information on run status of each channel.

(1) K7F-TC4A

(2) K4F-TC2A

3.2.8 Information on Thermocouple Type Specification Error

(K7F-TC4A : Address 67, K4F-TC2A : Address 19)

- 1) If other value than "0" to "6" is set at the addresses (Address 1 to 16 in K7F-TC4A, Address 1 to 4 in K4F-TC2A) used for specifying the type of the thermocouple which is connected to each channel of the thermocouple input module, error occurs.
- 2) If error occurs at a channel, then the channel runs with the type K as the type of the thermocouple.
- 3) The following shows indication of error information.

(1) K7F-TC4A

(2) K4F-TC2A
